Magnetic clutch

VALEO TM08, TM13, TM15 & TM16 are available either as a compressor and magnetic clutch assembly or as a compressor body that customers can fit with compatible magnetic clutches. The magnetic clutch design Valeo has been promoting for more than 20 years is now gradually adopted by other major market actors.

Our compressors and magnetic clutches have successfully passed the thousand hours of long validation tests in Valeo Compressors research center laboratory. Operational excellence was demonstrated during hot season testing on field under challenging climates in the most stressful conditions.

Being able to rely on our robust magnetic clutch provides the best way to reduce fuel consumption without using additional unloading devices that decrease significantly the efficiency and durability of the compressor. The range of Valeo magnetic clutches ensures an unmatched reliability and the longest durability that perfectly matches the Valeo TM08, TM13, TM15 & TM16 compressor qualities.

Swash plate system

The drive shaft, which is driven by the engine through the magnetic clutch, is equipped with a swash plate.
The drive shaft is supported by two radial bearings and two thrust bearings.
The swash plate is rotated by the drive shaft, and moves the pistons back and forth.

Piston Drive System

The pistons in the cylinders are mounted on the swash plate through hemispherical shoes.
Each piston has a compression head at each end. The rotation of the swash plate results in a reciprocating piston movement horizontal to the drive shaft.
The cylinders, which are arranged at 120° intervals around the drive shaft, are each divided into 2 chambers providing 3 front and 3 rear bores.
As each piston performs suction and compression at either end, the compressor operates as a 6 cylinder compressor.
Full charge of compressor oil
Each compressor is delivered filled with a specified quantity of compressor oil as described on its label.

The total amount of oil your air conditioning system requires is provided by the system designer or supplier.

Compressor
1. The direction of rotation is clockwise or counter clockwise (depending on clutch type).

2. The compressor must be operated under the conditions shown in the operation condition table shown at left.

</tr>
</tbody>
</table>

CAUTION!
The A/C cycle components must be designed so that the pressure in the cycle does not exceed 2.07 MPaG (21.4 kgf/cm², 299 psig)

4. Inclination limit at installation
The compressor must be installed on the vehicle within the range shown at left.
Compressor bracket
1. Install the bracket securely on the chassis frame or engine body. As the engine vibrations may be severe, the bracket and mounting bolts must be installed securely.
2. Vibration resistance
   There must not be any resonance under 250 HZ.

Magnetic clutch
1. Voltage
   - **DC 24 V**
     The terminal voltage of the magnetic clutch must exceed 21 V.
   - **DC 12 V**
     The terminal voltage of the magnetic clutch must exceed 10.5 V.

2. Ratio of magnetic clutch to drive pulley
   - When the compressor is driven from the pulley drive of the vehicle, the magnetic clutch to drive pulley ratio should avoid the range 1: 0.92-1.08 to limit vibration and resonance.
   - The compressor speed must not exceed the specified speed.

   **CAUTION!**
   Pulley ratio is the ratio of the magnetic clutch diameter to the drive pulley diameter.

3. Pulley alignment tolerance is less than 1mm (0.04 in).
4. Pulley groove: V-groove or V-ribbed.
5. The Belt tension must be adjusted to the tension specified by the belt maker.
1. During the off season of the air conditioner, operate the compressor for a few minutes once a week.
2. Do not drive through water. Water may damage the magnetic clutch, thus preventing normal operation.
3. Do not allow a compressor that has not been used for a long period to become wet.
4. Always charge the A/C system with the specified quantity of refrigerant.
5. Keep the compressor clear of water projection while cleaning the vehicle.
Maintenance precautions

Work area
As the components of air conditioners are particularly sensitive to moisture, dirt and rust, always observe the following:

• Work indoors whenever possible
• Select a flat ground work area
• Keep the work area clean
• Select a work area with adequate ventilation.

CAUTION!
Refrigerant itself is not harmful, but excessive accumulation in a closed area can cause oxygen deficiency.

• Keep open flame and inflammables away from the vehicle in which the air conditioner is being installed.
  (Fire is particularly dangerous during the gas leak inspection following installation)

WARNING!
Contact with flame and high temperatures can generate toxic gases.

Refrigerant handling

WARNING!
Direct contact with refrigerant can cause frostbite or blindness.
Always wear safety glasses and protective gloves.
Do not work with refrigerant close to your face.

1. Do not misidentify refrigerants
If an HFC-134a air conditioning system is mistakenly charged with another refrigerant, serious problems such as compressor seizing may occur. Therefore, confirm before charging with refrigerant that the type of air conditioning system is an HFC-134a system.
2. Do not release refrigerant into the air
Although HFC-134a is not subject to CFC regulations, it can have effect on global warming and so should not be released into the air. When removing refrigerant from the air conditioner system, always use a refrigerant recovery unit made especially for HFC-134a.

Compressor handling
Do not strike or unnecessarily turn the compressor upside down. If the compressor is knocked over or turned upside down during handling or installation, rotate the armature plate 5 or 6 times by hand to circulate the oil. Otherwise, oil in the cylinder during compressor start-up will cause valve damage and reduce durability.

Compressor removal
When the compressor is operational
1. Perform the oil return operation (see p.21).
2. Recover the refrigerant from the system using a refrigerant recovery unit.
3. Remove the compressor.
4. Drain the oil from the compressor and close all open connections immediately.
5. Check the oil quantity and the degree of contamination (see p.21).

When the compressor is inoperable
1. Recover the refrigerant from the system using a refrigerant recovery unit if the shut-off valves are removed with the compressor.
2. Remove the compressor.
3. Drain the oil from the compressor and close all open connections immediately.
4. Check the oil quantity and the degree of contamination (see p.22).
3-Handling instructions

Oil return operation
Compressor oil mixed with refrigerant is circulating in the air conditioning system.
Perform the oil return operation to return this oil to the compressor before removing components from the system.

1. Open the doors and windows and operate the blower motor at maximum speed.
2. Operate the vehicle engine at idling during at least 20 minutes.

Note: The maximum amount of oil cannot be recovered at higher speeds. This operation also requires a warm ambient temperature.

Oil handling

Oil specification
Use only ZXL 100PG PAG (DH-PS).

Oil quantity inspection
There is no particular need for frequent inspection or replacement, although it is recommended to check operating refrigerent pressures and oil levels at the start of the season.
Please replace the refrigerant and restore the system oil and refrigerant charge to factory specifications if:
• the AC system is opened for repair or replacement of any component (e.g.: evaporator, condenser or receiver drier)
• any loss of charge - refrigerant or oil - is detected.

Handling precautions
1. The oil must be free from dust, metal filings, etc.
2. Do not mix oils.
3. The moisture content must not exceed 1,000 ppm. (PAG oil only)
4. The oil easily absorbs moisture when the container is open. Therefore always seal the container immediately after use. (PAG oil only)
3-Handling instructions

Opacity
Color change
Foreign substances
Metal filings

Oil contamination
Unlike engine oil, no cleaning agent is added to the compressor oil. Even if the compressor is run for a long period (approximately 1 season), the oil never becomes turbid as long as there is nothing wrong with the compressor or its method of use. Inspect the extracted oil for any of the following.
• Increased opacity of the oil.
• Color change to red.
• Presence of foreign matter, metal filings, etc.

WARNING!
When system (oil) contamination is found during compressor replacement, flush the A/C system with a fluid that meets SAE J2670 and replace the drier (or accumulator).

Oil check
The compressor oil must be checked as follows when being charged into a used system.
1. Perform the oil return operation (see p.21).
2. Remove the compressor from the vehicle.
3. Remove the oil filler plug and drain the oil through the oil filler plug and the high and low pressure connectors.
4. Check the oil for contamination.
5. Fill the compressor with the specified amount of oil (see p.23) through the suction port or the oil filler plug in case of TM16.
CAUTION!
The specified oil quantity differs, depending on the type of air conditioner system. A label describing the specified quantity is attached to the compressor. Additionally, all of the oil cannot be removed when draining the compressor as some remains as an oil film on the inside of the compressor and the system components. Therefore, refer to the table at left when recharging the compressor with oil. Excess oil adversely affects the cooling capacity and the compressor.

6. Install the oil filler plug and tighten it to the specified torque.
Specified torque: 13 ~ 15 N·m
{1.3 ~ 1.5 kgf·m, 9.4 ~ 10.2 lbf·ft}

**Replacement of components**
When replacing the system’s component parts, supply the following amount of oil to the compressor.

<table>
<thead>
<tr>
<th>Component mounted</th>
<th>Amount of oil</th>

</thead>
<tbody>
<tr>
<td>Evaporator</td>

</tr>
<tr>
<td>Condenser</td>
<td>30 cm³ (1.8 cu in)</td>
</tr>
<tr>
<td>Receiver drier</td>
<td>10 cm³ (0.6 cu in)</td>
</tr>
</tbody>
</table>

After installing these component parts, check the compressor oil. Refer to page 22.
Running-in operation

Whenever moving parts have been replaced, it is necessary to run-in both the compressor and the magnetic clutch.

Compressor running-in

Reassembled compressors must be run-in after the leak test (see next page).

1. Check that the compressor contains the specified amount of oil.
2. Interconnect the suction fitting and the discharge fitting with the flexible hose.
3. Connect the two connector ports using a flexible hose.
4. Run the compressor at 500r/min for 30 minutes to 60 minutes. This operation may be performed by an electric motor or the engine of an automobile.
5. Replace the oil.
6. Repeat the leak test.

CAUTION!

While the compressor is being run-in in step 3 above, check the outside temperature of the front head. If the temperature exceeds 80°C (176°F), stop the running-in operation. Resume the operation when the head has cooled.

Magnetic clutch running-in

1. Install the clutch on the compressor.
2. Install the compressor on the test bench, and operate the compressor by running the system.
3. Maintain the compressor speed at 500 rpm. Operate the A/C switch through the ON/OFF cycle at least 50 times (“ON” for 10 seconds and “OFF” for 10 seconds).
3-Handling instructions

Leak test
The compressor must be checked for refrigerant leaks after it is repaired. The procedure is as follows.

1. Using the valve assembly (597017-1120), fill the compressor with refrigerant through the suction side, raising the refrigerant pressure to at least 0.39 MPaG (5 kgf/cm², 56.3 psig).

2. Check the compressor for leaks using a leak detector (597001-1020).

Storing a repaired compressor
If it is necessary to store a repaired compressor for some time before installation, evacuate the compressor and fill it with dry nitrogen gas through the suction fitting to raise the pressure to 49 ~ 150 kPaG (0.5 ~ 1.5 kgf/cm², 7.1 ~ 21 psi).
Refrigerant charging
Countermeasures to avoid charging with the wrong refrigerant have been taken. These include different shaped service valves, different service tool thread sizes, caution stickers and labels.

In order to prevent a liquid charge and greatly increase risks of compressor damage, do not shake or turn the refrigerant bottle upside-down.

Initial Leak Check
Using the leak detector, check the system connections for leaks.

As the system pressure is not yet high, only large leaks can be detected at this time.
3-Handling Instructions

Installation position
The compressor should be installed in the vehicle within the range shown on the left-hand figure. If it is installed outside this range, the compressor will be adversely affected. This compressor is equipped with a pressure feed lubrication system, which cannot function if the compressor is installed outside this range. If the compressor is installed outside the range shown on the left-hand figure any or all warranties may be rendered void.

Installation precautions
The new compressor is filled with the specified quantity of compressor oil and nitrogen gas (N₂). When mounting the compressor on the vehicle, please follow as below:
1. Loosen the discharge side connector’s cap and gently release nitrogen gas (N₂) from the compressor.
2. Turn the magnetic clutch’s armature plate several times by hand to distribute the oil which has settled in the cylinders.
3. When installing the compressor in service system, the compressor should be installed after adjusting the amount of oil, referring to “oil check” (p.22).

CAUTION!
Do not to let the oil escape
3-Handling Instructions

Piping precautions

1. Position the O-Ring against the bulge in the pipe when connecting hoses and pipes.
2. Coat the piping connections and the O-rings with PAG oil.

**CAUTION!**
Always use the specified oil for HFC134a systems to coat the O-rings.

3. Fit the nuts and unions tightly against the base of the companion pieces, then hand tighten the nut as much as possible. Then tighten to the specified torque.
4-Troubleshooting

Compressor troubleshooting

When a problem occurs during the compressor operation, it is often difficult to pinpoint exact the cause of the malfunction.

As long as the compressor maintenance is done correctly, there should not be any problem throughout the whole vehicle life, but should it happen, we hope this troubleshooting can help you solve the issue efficiently.

Below are listed most of the issues you may encounter while the A/C is ON. Please refer to the compressor troubleshooting tree to localize the malfunction symptom, then look at the table (p.30-32) for the appropriate counter measure.

Most of the malfunction symptoms can be classified in the following categories:

1. Insufficient cooling capacity
2. Abnormal noise
3. Smoke

In case of insufficient cooling capacity, we recommend that you prepare a gauge manifold to measure the pressure of both discharge and suction sides (for a detailed diagnosis by gauge pressure, see p.33 - 34).

Magnetic clutch
Removal

1. Remove the center bolt using the drive plate holder (597031-2600) to prevent armature assembly rotation.

2. Remove the drive plate using the drive plate puller (597032-2622). Remove the shims from the compressor drive plate or drive shaft.

3. Remove the snap ring using external snap ring pliers.

4. Position the center pulley puller at the end of the driveshaft.

5. Attach a suitable pulley puller to the pulley. Hook the puller claws to the edge of the pulley as shown.

6. Tighten the center pulley puller bolt to remove the pulley.

**CAUTION!**
Do not clip the puller claws into the pulley groove to prevent pulley groove damage.
6-Service procedures - Magnetic clutch

7. Remove the field coil's lead wire bushing using the remover (597035-3820).
8. Remove the three field coil/compressor screws. Then remove the field coil.

CAUTION!
Do not hold the field coil by the harness.

Inspection
1. If the contact surface has been damaged by excessive heat, the armature and pulley must be replaced.
2. Check the appearance of the pulley assembly. If the contact surface of the pulley is excessively grooved due to slippage, both the pulley and armature must be replaced. The contact surfaces of the pulley assembly must be cleaned with a suitable solvent before reinstallation.
3. Check the field coil for a loose connector or cracked insulation.
6- Service procedures - Magnetic clutch

Magnetic clutch
Installation
1. Install the field coil on the compressor (with the harness on top) and tighten the mounting screws to the specified torque.
   Specified torque: 4 ~ 6 N·m
   \{0.4 ~0.6 kgf·m, 3.0 ~ 4.4 lbf·ft\}

2. Carefully place the wire harness bushing.
3. Install the pulley assembly using the pulley installer (597034-3301) and a hand press.
   **CAUTION!**
   Use only a press to install the pulley assembly. Do not use a hammer. A hammer will damage or deform the pulley.

4. Install the snap ring (beveled edge up) using external snap ring pliers.

5. Install the armature assembly on the driveshaft together with the original shim(s). Press the armature assembly down by hand.
6. Install the center bolt and tighten the bolt to the specified torque using the drive plate holder (597031-2600) to prevent armature assembly from the rotating.
   Specified torque: 12 ~ 14 N·m
   \{1.2 ~ 1.4 kgf·m, 8.7 ~ 10 lbf·ft\}
   **CAUTION!**
   After tightening the center bolt, check that the pulley rotates smoothly.
7. Check that the clutch clearance is as specified. If necessary adjust the clearance using shim(s). Adjusting shims are available in the following thickness:

<table>
<thead>
<tr>

</tbody>
</table>

**Specified clearance: 0.3 – 0.6 mm (0.012 – 0.028 in)**

8. Run-in the clutch as described on page 24.
Shaft seal assembly

Removal

1. Remove the magnetic clutch assembly as described on page 36.
2. Remove the oil filler plug and then drain the oil.
3. Remove the five bolts securing the heads.

4. Remove the snap ring using internal snap ring pliers.

5. Insert the remover (597035-5520) into the shaft seal and turn it until it hits the shaft seal case. Then, pull the remover up to remove the shaft seal.
Inspection
The shaft seal must not be reused. Always use a new shaft seal when reassembling the compressor. Ensure that the seal seat is free from lint and dirt that could damage the shaft seal lip.

Installation
Before installation refer to “Inspection”
Clean the sealed section of the front cylinder head.

1. Coat the new shaft seal and the front cylinder head with clean compressor oil. If the slip faces are dirty, clean them with thinners and, after drying the clean faces, apply clean compressor oil to them.

2. Fit the guide (597067-1102) onto the end of the drive shaft.

3. Insert the shaft seal through the guide into the front cylinder head.

4. Install the shaft seal as far as possible into the front cylinder head using the installing end of the remover (597032-5520). Remove the guide (597067-1102) from the drive shaft.
5. Install the snap ring using internal snap ring pliers. Press the snap ring using the installing end of the remover (597032-5520) until a “click” is heard.

Note
1. When installing the snap ring, the round edge of the snap ring must face downward, as shown on the left-hand figure.
2. Check the snap ring is properly installed, as shown on the left-hand figure.
3. Install the oil drain plug with a new O-ring, thinly coated with clean compressor oil and tighten it to the specified torque
